

---

A SINGULAR STONE.—We have lying upon our table a very singular stone, picked up on the Kentucky beach of the Ohio River, near the large rock known as the one having the "Indian head" cut upon it. This stone is nearly three inches long, and about one and a half inch wide by three quarters of an inch thick. It is perfectly hollow, with the exception of a loose pebble inside of it, which rattles when the stone is shaken. What made this stone hollow, and how did the pebble get inside?—*Portsmouth Tribune.*
